Evaluation, Treatment, and Outcomes of Children with Unilateral Sensorineural Hearing Loss: Systematic Review

There are two current reviews in the literature that investigate the appropriate evaluation and outcomes of pediatric unilateral sensorineural hearing loss (USNHL). However, there are no current guidelines describing the diagnosis and treatment of these children to achieve the best possible outcome. The objective of this study was to systematically evaluate the literature on pediatric USNHL. The purpose of this review was to determine the evaluation of choice and the impact of treatment on audiologic and academic performance outcomes.
