

## Hemothorax Guidelines

1. Place chest tube if HTX present per chest tube protocol (1)
  - a. Pigtail or large bore chest tube (14-32F) (2-4)
  - b. One dose of antibiotics starting just prior to placement (5, 6)
    - i. 1<sup>st</sup> generation cephalosporin
2. Order post-procedure CXR
3. If radiographic evidence of retained HTX
  - a. **If within 24 hours**, consider placing 2<sup>nd</sup> chest tube
  - b. Order a **contrasted chest CT** on **day 3** if HTX is still present on CXR (7)
    - i. If  $\geq 300\text{mL}$  HTX (formula  $v=d^2 \times l$ )<sup>1</sup> present on CT (8, 9)
      1. VATS on or before day 7 (1, 7-13)
      2. Consider intrapleural -tPA (11, 14-18) if poor operative candidate or other indications (t-PA is contraindicated in any patient with intrathoracic arterial bleeding/injury including pulmonary laceration and/or intercostal bleeding). Administration of TPA is not intended to prevent VATS in operative candidates.<sup>2</sup>
        - a. 24mg t-PA in 48mL NS (t-PA concentration 0.5mg/mL) injected in chest tube daily x 3 days (16, 19-21) using sterile technique
        - b. Clamp chest tube x 1 hour (20)
        - c. Roll patient to ensure distribution throughout chest
        - d. Unclamp tube and allow drainage
    - ii. If  $< 300$  mL HTX present, no additional intervention needed (1, 8)
4. If no radiographic evidence of retained HTX
  - a. Place tube to water seal if no evidence of PTX on morning CXR and no air leak in tube
  - b. Remove chest tube when output  $< 200$  mL/24hr (22)

---

<sup>1</sup> **d** = greatest depth of hemothorax on a single CT image, **l** = greatest length of the hemothorax.

<sup>2</sup> To find the Trauma Retained Hemothorax order set in eStar you must type "hemothorax" in the order section, order set will then populate for you. It will not come up if you type t-PA or alteplase.
