

Postdoctoral Position in Antibody Discovery Technologies

Georgiev Laboratory

Program in Computational Microbiology and Immunology

The Georgiev Laboratory and the Program in Computational Microbiology and Immunology (<https://www.vumc.org/ig-lab/>) has an opening for a postdoctoral position in the area of antibody discovery. We are looking for creative individuals who have a keen interest in the development of innovative technologies for antibody discovery and their application to diverse areas of biomedical significance, including infectious diseases, cancer, and autoimmunity. A strong background in relevant research areas, such as microfluidics, single-cell sequencing, B cell immunology, protein production, structural biology, and/or bioinformatics will be a plus. This position will offer an outstanding opportunity to build a unique skillset at the interface of immunology and computational science, with an emphasis on efforts that have a high potential for ground-breaking discoveries for therapeutic, vaccine, and platform technology development. Exceptional candidates who are interested in joining our fast-paced collaborative environment should send a cover letter and a current CV to Ivelin Georgiev, ivelin.georgiev@vumc.org.
